Five StarsBy Epi KidExcellent book even though there is now a newer version of Epi Info available on the CDC web site.0 of 0 people found the following review helpful. Three StarsBy VM WesterbergComprehensive text for research clinicians. Recommendable.1 of 1 people found the following review helpful. I've been using Epi Info for over 20 years, through its DOS and now its Windows

versions...By Consuelo Beck-SaguAnd I still love it. I've used it for dozens of epidemiologic and clinical studies. I enter data directly in the field into EpiInfo, or transform datasets in SPSS, Excel, comma delimited files, WHATEVER, and analyze it in Epi Info. OpenEpi is a gift--I'm sure that I use it at least once a day to see if changes that are being billed as statistically significant really are significant (and vice versa). I use it a lot also for 95% CIs around prevalence estimates, and for sample size calculations and power analyses when writing my grant proposals. Now, because both Epi Info and OpenEpi are VERY intuitive and "easy", self-explanatory, WHY would you ever need the book? Glad you asked. It's like NO software manual that you will ever read. Entertaining, simple, and wise, the authors' prose explains Kaplan-Meier survival analysis, logistic regression, and other complex statistics with just enough whimsy to appeal to the broadest audiences, from clinicians afraid of touching a laptop to youth who will otherwise not touch anything that is Microsoft-related. It's just extremely useful. No ego gets in the way of these authors. The book is beautifully bound and excellently indexed. And of course, as would be expected with a book describing free software, it is shockingly cheap. Love this book.

Epi Info is a free computer program from the Centers for Disease Control and Prevention(CDC), downloaded 2 million times since 1998, and referred to in over 1 million web pages. It allows anyone with a computer to design a questionnaire, enter data, and do tabulation and statistical analysis. This book tells how to use Epi Info for rapid surveys and research studies and for constructing electronic medical records, public health surveillance systems, graphs, and maps. Sample programs can be downloaded from the web.
